

YASSEN HASSAN GABER HASSAN ALY

Junior Full-Stack Web Developer | AI & Business Automation

Alexandria, Egypt • yassenhassan151@gmail.com

Portfolio: my-portfolio-puce-delta-i5xysrwxle.vercel.app • GitHub: github.com/yvssen-ai

PROFESSIONAL SUMMARY

Third-year Artificial Intelligence student with 1.5 years of hands-on, project-based experience as a Junior Full-Stack Web Developer, building and deploying production web applications for real businesses. Works across the full stack: React, Next.js, and TypeScript on the frontend; PostgreSQL schema design, server-side functions, Row-Level Security, and multi-tenant data isolation on Supabase; deployed on Vercel with Git/GitHub version control. Designs systems that enforce correctness and security at the database layer rather than trusting the client. Secondary specialisation in AI and business process automation with n8n, including a live AI agent that qualifies inbound leads over the Telegram API and writes structured briefs to Google Sheets. Seeking a junior full-stack development, web development, or AI automation role in the UAE.

TECHNICAL SKILLS

- Frontend Development:** React, Next.js, TypeScript, JavaScript (ES6+), Vite, HTML5, CSS3, responsive web development, UI/UX implementation, Progressive Web Apps (PWA), GSAP / ScrollTrigger, Three.js, Lottie, cross-browser and cross-device optimisation
- Backend, Databases & APIs:** Supabase, PostgreSQL, SQL, relational schema design, server-side database functions (RPC), Row-Level Security (RLS), multi-tenant data isolation, composite foreign key constraints, token-based access control, REST API integration, webhooks, third-party service integration. Node.js, Python, payment gateway integration.
- AI & Automation:** n8n workflow automation, AI agents, Google Gemini API, Telegram Bot API, Google Sheets integration, business process automation, trigger-based and scheduled workflows, conversational state management, API orchestration, webhook handling, data mapping and transformation, automated reporting and notifications, AI-assisted development. Gmail automation, Slack notifications.
- Development Tools:** Git, GitHub, Cursor, v0.dev, Bolt.new, browser developer tools
- Deployment & Hosting:** Vercel, Netlify, environment configuration, domain and DNS setup, production troubleshooting
- CMS & Platforms:** WordPress, Gutenberg block themes and Site Editor, custom block markup
- Design:** Figma, Canva, Adobe Photoshop, Adobe Illustrator, brand identity systems, typography
- Languages:** Arabic (Native), English (Fluent — professional working proficiency)

PROFESSIONAL EXPERIENCE

NEXERA — Founder | Full-Stack Development & AI Automation

Alexandria, Egypt | 7 / 2026

- Founded and led NEXERA as a digital solutions initiative, providing businesses with modern web applications, e-commerce platforms, AI-powered automation, and custom digital systems.
- Own end-to-end solution development, including frontend implementation, third-party integrations, deployment, and workflow automation, while leveraging AI-assisted development and modern web technologies.
- Handle client acquisition and requirements scoping directly, translating business needs into technical specifications and delivering tailored digital solutions.

Junior Full-Stack Web Developer & Automation Developer — Freelance (YS Studios)

Alexandria, Egypt | 2 / 2025 – Present | 1.5 years | Remote client projects across Egypt and the Gulf

Web Development

- Developed and deployed responsive web applications for café, bakery, retail, and bespoke-manufacturing clients, owning delivery end-to-end from requirements gathering through production release and post-launch support.
- Built frontend interfaces with React, Next.js, TypeScript, and Vite, implementing responsive layouts, progressive web app behaviour, and scroll-driven motion with GSAP/ScrollTrigger, Three.js, and Lottie.
- Designed and implemented PostgreSQL data layers on Supabase — relational schema design, server-side functions, Row-Level Security policies, and multi-tenant isolation — treating the database as the security boundary rather than trusting client-side validation.
- Eliminated a class of billing defects across projects by storing all monetary values as integer minor units and re-pricing every transaction server-side from the catalogue, so client-submitted prices are never trusted.
- Integrated REST APIs, webhooks, and third-party services to connect web applications with external business systems and automation workflows.
- Deployed and maintained production applications on Vercel and Netlify, configuring builds, environments, and custom domains; managed source control and revision history with Git and GitHub.

- Extended a proprietary WordPress block-theme platform by analysing its architecture and delivering custom Gutenberg block markup, reusable CSS kits, and code-injection modules, meeting the design specification despite platform plugin restrictions.
- Applied AI-assisted development tools (Cursor, v0.dev, Bolt.new) to accelerate build cycles while retaining full ownership of architecture, code review, refactoring, and debugging.

AI & Business Automation

- Developed and deployed an AI-powered lead qualification workflow with n8n and the Telegram Bot API, automating multi-turn client conversations, lead qualification, structured data capture in Google Sheets, and real-time notifications to streamline lead intake and ensure immediate first-response handling.
- Designed and deployed an n8n workflow integrated with a live Supabase production database that aggregates daily order and revenue data and delivers an automated scheduled report, replacing a manual reconciliation process.
- Engineered trigger-based and scheduled automation workflows integrating database queries, REST APIs, authenticated credentials, conditional logic, per-contact state management, and cross-system data mapping to automate end-to-end business processes.

SELECTED PROJECTS

Solis — Café & Bakery Ordering Platform | *React, Vite, GSAP, Supabase, PostgreSQL, RLS*

Live: solis-azure.vercel.app • Source: github.com/yvssen-ai/Solis

- Production ordering site serving the full menu from PostgreSQL, with a React/Vite frontend and GSAP motion.
- Routed checkout through a single server-side function so the browser submits only item IDs and quantities, and implemented server-side price resolution to ensure all pricing data is calculated and validated on the backend, preventing client-side price manipulation and maintaining secure, consistent transaction data. Implemented account-free order tracking via receipt tokens and stored all currency as integer piastres to eliminate rounding errors.

Tailor Workshop — Bespoke Tailoring Management System (PWA) | *Next.js, TypeScript, Supabase, PostgreSQL, RLS*

Live: tailor-yassen.vercel.app • Source: github.com/yvssen-ai/Tailor

- Developed and deployed an iPad-first Progressive Web Application (PWA) for a bespoke tailoring workshop, implementing customer management, measurement profiles, garment configuration, B2B pricing, and production workflow tracking across Cutting, Assembly, Ready, and Store using QR and NFC technology.
- Made the database the security boundary: order tables are read-only to every client, and each mutation passes through a function that re-derives the tenant from the auth token and re-prices from the catalogue, so client-supplied prices are ignored.
- Used composite foreign keys so a row cannot reference another workshop's data even with RLS policies disabled, and stored all money as integer minor units rather than floats.

AI Receptionist — Automated Lead Qualification Agent | *n8n, AI agent, Google Gemini, Telegram Bot API, Google Sheets*

Source: github.com/yvssen-ai/AI-WhatsApp-Receptionist

- Live conversational agent that answers scoped questions on services and timelines, shares portfolio links, and collects a project brief one field at a time (name, brand, service, scope, budget, timeline).
- Designed an AI agent grounded exclusively in provided context to prevent unsupported responses, with per-contact conversation memory that maintains multi-message interactions as a single session; automatically records completed client briefs in Google Sheets and sends real-time mobile notifications.

EDUCATION

B.Sc. Artificial Intelligence — Third Year (In Progress)

Expected Graduation: 2028

Arab Academy for Science, Technology & Maritime Transport (AASTMT), Alamein, Egypt

- Relevant coursework: Data Structures & Algorithms, Machine Learning, Databases, Object-Oriented Programming, Software Engineering

ACHIEVEMENTS & CERTIFICATIONS

- 2nd Place — RoboCup Junior Egypt, 2018, following a specialised robotics training programme.
